FOR PATIENTS TO
PARTICIPATE IN CLINICAL
TRIALS**

PatientTrials helps clinicians and sponsor companies run global clinical trials virtually or through selected sites, more efficiently in a closed community setting over HIPAA & GDPR compliant collaboration platform. PatientTrials aims to improve patient adherence by engaging participants with information on the progress of treatment at their fingertips that promotes self-care. PatientTrials captures high-quality patient generated data through solutions based on instant messaging, AI and bots, is poised to make a positive impact on drug development. Monitored by proprietary AI agent for adverse events, PatientTrials reduces study risk and lowers development costs. Founded in 2017, PatientTrials is the first company to bring clinical trials on to a HIPAA & GDPR compliant instant messaging platform.

Built on highly secured integrated enterprise SaaS platform ServiceNow, PatientTrials provides an ability for clinicians and sites to self-sign up and create/promote study for patient recruitment in minutes. The platform engages patients with pre-scheduled surveys setup by study PI or study coordinator, increasing the survey responses to almost 99%. The platform also supports scheduled reminders based on settings at Study level.

PatientTrials with native integrations to popular CTMS systems, provides an option to de-identify patient data, allowing them to use the engagement platform that improves patient retention. Dashboards built for Principal Investigator role and other roles, provides patient adherence and engagement statistics across studies, calling out for an action on potential patient drop outs thus improving efficiencies in managing clinical trials at site level.

An unified interface powered by PatientTrials empowers clinicians and site staff to run multiple clinical trials in parallel across different sponsors. On the other end, sponsors have visibility on sites performance and patients engagement across their studies. A proprietary AI agent parses patient generated data to identify & predict possible AE's, thus reducing overall study risk.
